

If the efficiency value for the water heater is unknown, the year of installation or manufacture should be chosen from the drop-down menu. The year can often be determined by the manufacturer's data label or tag on the equipment, although sometimes the date is coded in the serial number. When the year installed (or manufactured) is entered the Home Energy Score will use a representative value for systems installed/manufactured that year. Choose 1972 for systems manufactured prior to 1972.
