

GreenHome INSTITUTE

This is the total floor area that is intentionally heated and/or cooled, including conditioned basements. Do not use commas in the entry. Unconditioned spaces should NOT be part of the total, including all crawlspaces, as well as garages, unconditioned basements, etc. To calculate conditioned floor area, include the total ft² floor area for all stories of the home. For example, if the house has a 40 x 30 ft. conditioned 1st floor, a 30 x 20 ft. conditioned 2nd floor, and a 20 x 30 ft. unconditioned garage, the number to enter would be 1800 ft² ($40 \times 30 + 30 \times 20 = 1200 + 600 = 1800$) - the garage is excluded. If this house had a conditioned basement with the same footprint as the first floor, the number to enter would be 3000. The conditioned floor area should not include any crawlspace area, conditioned or otherwise.
