

GreenHome INSTITUTE

Enter the total window area (in square feet) for each side of the home. Include glass doors as windows.

It is not necessary to measure every single window individually. Most houses have only a small variety of differing window sizes, so the measurement of one window representative of a group of similarly sized windows can be multiplied by the number of windows in the group. Window frames should be included in the measurements. Calculate the total window area (ft²) for each side of the house, rounded to the nearest square foot.
